Employees API

- In this lab you have to use the learned techniques in the class to build a app with a list of employees fetched from employee's API.
- Using this API: <http://jsonplaceholder.typicode.com/users>
- fetch all employees' details into a list in your app.

Employees API

- When the app run for first time, a list of employees (name and emails) shows up in the table view.
- When the user selects any employee from the list, the app navigates to a detail views shows more details about the selected employee including his/her address and company name.

Implementation and Reflection

01

Implement the previous features using URL Session and data task, use JSON Decoder or JSON Serialization and explain your choice in your reflection.

02

Use Delegate Protocol or completion Handler and explain the process in your reflection.

03

Submit your project with recorded video and reflection text.
